Burlington Overhead Crane Safety Training

Burlington Overhead Crane Safety Training - The overhead crane safety training course is intended to equip the operators with the right knowledge and skills in the areas of: crane safety measures, materials handling, accident avoidance, and equipment and stock protection. Each of the trainees will get to learn about numerous kinds of overhead cranes, their capabilities and their uses in different environments. For operators who are trained and licensed, the shift in liability moves from the company to the operator. Hence, the course emphasizes individual operator tasks.

The operators in the overhead safety training course would be given instruction about the proper ways for carrying out checks: the more detailed in-depth inspection and the pre-shift inspection. These are critical every day routines that should be logged. Properly recorded pre-shift inspections help to protect the business from liability in case of an accident. Pre-shift checks also prevent accidents, damage and costly repairs. Operators learn how to designate a specific person to carry out inspections, how to report problems, and how to maintain the log book.

Each and every check must be documented and carried out regularly. Things which must be checked for possible problems, comprise: increase in the throat opening, hooks for cracks, degree of twist; hoist ropes for corrosion, loss of diameter, worn wires, kinks and bird caging, broken wires, chemical and heat damage; chains for nicks and gouges, twists, cracks and corrosion, distortion, excessive wear, pits, stretching, damage from extreme heat.

Operators learn right rigging methods in this course. Rigging involves understanding the manufacturer's data plate, determining the material weight to be lifted, selecting the gear, and using safe practices to secure the load. The course cover in detail the following: safe working loads, and the capacities of chains, ropes, slings, hooks and shackles.

It is important to understand who can utilize the cranes at your facility, physical requirements of the job, and operator credentials required for permits and specialized tasks. Safety should be prioritized when operating near pedestrian traffic.

Safe crane operation consists of responsibilities like undertaking visual inspections, checking for hydraulic leaks, checking the safety guards, testing the controls, examining the hook and hoist rope, limit switches and braking mechanisms. Correct reporting procedures are important. These topics are all included in depth in the course.

The course also consists of the right lifting and moving methods with cranes and hoists. Operators would also learn right hand signals. Training involves how to raise the load, attach the load, abort a lift, set the load and unhook the slings.

Moving the load involves some steps: starting and stopping procedures, controlling and guiding the load, observing working conditions and working with signals. Operators need to know how to proceed in case of a power failure. The program covers methods for lowering the load and removing the slings, parking the crane, storage equipment, and securing an outdoor and indoor crane.
